

BUIDL CTC 2026 FALL · RWA

Proofmark

The compliance gateway for Creditcoin.

External KYC/AML credentials in. An Ethereum source event proven through Attestcoin. Frozen, application-specific policy state on Creditcoin out.

CURRENT TEST SUITE

180 tests

57 Solidity · 123 TypeScript

SANCTIONS CORPUS

26,566

OFAC · UN · EU source entries

ON-CHAIN CLEARTXT PII

0 bytes

metadata is pseudonymous and linkable

THE PROBLEM

A wallet can be verified and still be unusable.

Every regulated Creditcoin application must answer two questions: **who checked this wallet, and is that check sufficient for this asset now?**

PER-APP KYC

Rebuild everything

Vendor contract, PII flow and evidence operations repeat for every application.

REUSABLE BOOLEAN

“KYC passed”

It hides method, jurisdiction, issuer, freshness and sandbox provenance.

CROSS-CHAIN COPY

Trust the relayer

A signing key becomes the compliance truth. The trust problem only moves.

CONSUMER	MINIMUM POLICY CAN DIFFER	SAME CREDENTIAL?
KR production RWA	Document authenticity · bank account · sanctions · live regime · KR jurisdiction · trusted issuer	No sandbox mark
KR pilot	Same method bits, but explicitly sandbox regime and seven-day freshness	Sandbox accepted
EU asset	Different identity and screening combination under another issuer/regime	Another policy

A portable credential needs a **consumer-owned policy layer**, not a universal verdict.

Verify. Prove. Enforce.

Proofmark normalizes what an issuer actually checked and makes it enforceable by any Creditcoin application.

1 · VERIFY

External credential

Reference KR adapter today. Established providers and regulated issuers become adapters—not competitors we must replace first.

method bits

regime

2 · PROVE

Attestcoin

The issuer emits on Ethereum. BlockProver verifies the exact source transaction on Creditcoin. No Proofmark oracle signature.

source proof

replay - safe

3 · ENFORCE

Frozen policy

Methods, assurance, age, regime, jurisdiction, issuer and roster freshness determine the answer. Asset contracts bind only to frozen policy.

isVerified

RWA gate

Positioning: the Creditcoin-native normalization and policy layer above credential providers.

Ethereum provenance. Creditcoin policy.

A sandbox mark cannot pass the production policy.

Policy #1 · KR production

FAIL

methods 0x10024 · assurance 2 · max age 30d
regime 1 · jurisdiction 410 · pinned issuer · frozen

Policy #2 · KR sandbox pilot

PASS

methods 0x10024 · assurance 2 · max age 7d
regime 2 · jurisdiction 410 · pinned issuer · frozen

Both policies are frozen on CC3. The pilot note binds to #2 because the public journey uses demo identity and bank adapters. No institution is contacted, and the chain cannot mistake that for production.

We attacked the state transitions, not just the happy path.

FAILURE MODE	CONTROL NOW IN CODE	REGRESSION
Wrong-chain same address	ASC pins source chainKey and contract; source can be configured once	WrongChain
Stale resurrection	Per-subject source block and transaction-index cursor	SameBlockTxIndex
Roster key relabelling	Boundary leaves recomputed from both key and mark	RelabelledBoundary
Mutable asset policy	Permanent freeze; token constructor rejects mutable policy	FrozenPolicy
API replay	Wallet/flow/consent binding plus on-chain issueOnce	IssueOnceReplay
Worker stranded retry	Pending jobs queued every polling cycle	retry scheduling

SOLIDITY

57 / 57

state, policy, gate, proof and ordering

TYPESCRIPT

RECALL CORPUS

200 / 200

CLEAN CORPUS

610 / 610

EVIDENCE CONTROL	STATUS
Consent version bound to wallet signature and flow	live code
AES-256-GCM pilot vault and retention purge	implemented
Rescreen, revoke batch and manual review decisions	implemented
Opaque erasure event after record deletion	tested
Managed DB/KMS, access controls and backup	not built

Public sandbox: no persistent server evidence. **Production path:** fails closed without persistent encrypted storage. PEP and adverse media remain zero bits until licensed sources are connected.

Creditcoin becomes the compliance decision layer for credentials issued elsewhere.

More useful reads

RWA, lending and stablecoin contracts query durable eligibility state. Reads remain permissionless and free.

Issuer distribution

One Creditcoin adapter exposes established credentials to multiple applications and policies.

Attestcoin necessity

Proven source events replace the operator signature that otherwise owns cross-chain compliance.

We do not claim current ATC demand from reads: Attestcoin states reads are free. Future spoke-chain writes are roadmap, not revenue today.

We integrate credential leaders; we compete on Creditcoin policy.

ALTERNATIVE	STRENGTH	PROOFMARK WEDGE	OUR GAP
Sumsub + Chainlink CCID	Enterprise KYC and reusable credentials across major EVM chains	Creditcoin - native Attestcoin provenance and frozen per - asset policy	distribution · vendors
zkMe zkKYC	ZK credentials, selective disclosure, multi-jurisdiction products	Creditcoin source proof, lifecycle state, roster and asset gate	ZK privacy · adoption
Direct vendor integration	Authoritative checks and contracted operations	one normalized credential path for many Creditcoin apps	we still need the rail
App allowlist	simple for one launch	portable, auditable issuer/regime/freshness semantics	more moving parts

Moat to build: provider adapters + policy semantics + lifecycle evidence + Creditcoin integrations.

What is not a moat: a bitmap or a team - controlled issuer by itself.

Keep reads free. Sell institutional operations.

PAID SURFACE	CHARGING UNIT	BUYER
Issuer platform + SLA	annual contract	regulated issuer · RWA platform · lender
Issuance + rescreening	check / active wallet	issuer or application
Evidence vault + audit export	annual tier + storage	obligated institution
Provider / jurisdiction adapter	build + subscription	credential provider or ecosystem
Policy integration	project + support	Creditcoin application

FIRST BUYER

RWA / lender

consumes frozen wallet policy

FIRST SUPPLIER

Credential issuer

provides an independent credential

MARKET PROOF

2 design partners

not an invented top-down TAM

The next milestone is a priced end-to-end pilot and renewal proposal—not a vanity user count.

People who ran the off-chain stack before building the on-chain layer.

NAME	ROLE	RELEVANT BACKGROUND
Ash Han	CEO	Founded and ran GDAC; VASP registration, ISMS and FinCEN MSB experience. Interchain ecosystem background.
Youree Lee, Ph.D	Chief Compliance Officer	Built AML/KYC policy and handled supervisory examinations at GDAC's operator; prior banking roles.
Yongku Lee	CTO	Exchange core, wallet, custody and security systems at production scale.
Incheol Yang	Product / protocol	Exchange core and non-face-to-face KYC integration; Solidity work across DEX protocols; current implementation lead.

The operating history belongs to the prior regulated company and individuals; **Validator Inc. does not claim those licences.** The next proof must come from external design partners.

THE ASK

USD 100k · 12 weeks · milestone-gated.

\$25k · Productize

managed-vault/KMS design, role separation,
adapter specification, design-partner discovery

\$35k · Integrate

one external credential adapter, distributed API
controls, partner sandbox

\$40k · Pilot

security-review fixes, two partners or one paid pilot,
measured lifecycle SLA

Investment view: fund the external proof. Do not underwrite traction that does not exist yet.

Success: independent credential → Attestcoin → frozen Creditcoin policy → partner asset gate.
